# Engine-defined concepts

In addition to concepts defined in script files, the system automatically defines a bunch of dictionary-based sets as well as dynamically computed concept members.

| set            | description                     |
|----------------|---------------------------------|
| ~web_url       | word is a web url               |
| ~email_url     | word is an email address        |
| ~kindergarten  | word learned early in life      |
| ~grade1_2      | word learned in these grades    |
| ~grade3_4      | word learned in these grades    |
| ~grade_5-6     | word learned in these grades.   |
|                | Unmarked words are learned      |
|                | even later                      |
| ~utf8          | word has nonascii characters    |
| ~daynumber     | word could be a number of a day |
|                | in a month                      |
| ~yearnumber    | word could be the number of a   |
|                | recent year                     |
| ~dateinfo      | phrase is month day year of     |
|                | some kind                       |
| ~kelvin        | temperature marker              |
| ~celcius       | temperature marker              |
| ~fahrenheit    | temperature marker              |
| ~twitter_name  | twitter user name               |
| ~hashtag_label | twitter topic reference         |

### Interjections, "discourse acts", and concept sets

Some words and phrases have interpretations based on whether they are at sentence start or not. E.g., good day, mate and It is a good day are different for good day.

Likewise sure and I am sure are different.

Words that have a different meaning at the start of a sentence are commonly called interjections.

In ChatScript these are defined by the livedata/interjections.txt file. In addition, the file augments this concept with "discourse acts", phrases that are like an interjection. All interjections and discourse acts map to concept sets, which come thru as the user input instead of what they wrote.

For example yes and sure and of course are all treated as meaning the discourse act of agreement in the interjections file. So you don't see yes, I will go coming out of the engine.

The interjections file will remap that to the sentence  $\sim$ yes, breaking off that into its own sentence, followed by I will qo as a new sentence.

These generic interjections (which are open to author control via interjections.txt) are:

| interjection                 | description |
|------------------------------|-------------|
| ~yes                         |             |
| ~no                          |             |
| ~emomaybe                    |             |
| ~emohello                    |             |
| ~emogoodbye                  |             |
| ~emohowzit                   |             |
| ~emothanks                   |             |
| ~emolaugh                    |             |
| ~emohappy                    |             |
| ~emosad                      |             |
| ~emosurprise                 |             |
| $	ilde{\ }$ emomisunderstand |             |
| ~emoskeptic                  |             |
| ~emoignorance                |             |
| ~emobeg                      |             |
| ~emobored                    |             |
| ~emopain                     |             |
| ~emoangry                    |             |
| ~emocurse                    |             |
| ~emodisgust                  |             |
| ~emoprotest                  |             |

| interjection           | description |
|------------------------|-------------|
| ~emoapology ~emomutual |             |

Because all interjections at the start of a sentence are broken off into their own sentence, this kind of pattern does not work:

### u: (~yes \_\*)

You cannot capture the rest of the sentence here, because it will be part of the next sentence instead. This means interjections act somewhat differently from other concepts.

If you use a word in a pattern which may get remapped on input, the script compiler will issue a warning. Likely you should use the remapped name instead.

The following concepts are triggered by exactly repeating either the chatbot or oneself (to a repeat count of how often repeated). Repeats are within a recency window of about 20 volleys.

| concept       | description |
|---------------|-------------|
| ~repeatme     |             |
| ~repeatinput1 |             |
| ~repeatinput2 |             |
| ~repeatinput3 |             |
| ~repeatinput4 |             |
| ~repeatinput5 |             |
| ~repeatinput6 |             |
|               |             |

### POS (Part of Speech) Tags

Words will have pos-tags attached, specififying both generic and specific tag attributes, eg., ~noun, ~noun\_singular.

### Generic Specifics

| nouns                 | description |
|-----------------------|-------------|
| ~noun                 |             |
| ~noun_singular        |             |
| ~noun_plural          |             |
| ~noun_proper_singular |             |
| ~noun_proper_plural   |             |

| nouns                    | description |
|--------------------------|-------------|
| ~noun_gerund             |             |
| ~noun_number             |             |
| ~noun_infinitive         |             |
| ~noun_omitted_adjective  |             |
|                          |             |
| verbs                    | description |
| ~verb                    |             |
| ~verb_present            |             |
| ~verb_present_3ps        |             |
| ~verb_infinitive         |             |
| ~verb_present_participle |             |
| ~verb_past               |             |
| ~verb_past_participle    |             |
| ~aux_verb                |             |
| ~aux_verb_present        |             |
| ~aux_verb_past           |             |
| ~aux_verb_future         |             |
| ~aux_verb_tenses         |             |
| ~aux_be                  |             |
| ~aux_have                |             |
| ~aux_do                  |             |

Auxilliary verbs are segmented into normal ones and special ones. Normal ones give their tense directly. Special ones give their root word. The tense of the be/have/do verbs can be had via `properties() and testing for verb tenses

| adjectives                     | description   |
|--------------------------------|---------------|
| ~adjective                     |               |
| ~adjective_normal              |               |
| ~adjective_number              |               |
| ~adjective_noun                |               |
| ~adjective_participle          |               |
|                                |               |
| adjectives in comparative form | n description |
| ~more_form~most_form           |               |
| ~adverb                        |               |
| ~adverb_normal                 |               |

| adverbs in comparative form                                      | description                       |
|--|-----------------------------------|
| ~more_form~most_form   |                                   |
| ~pronoun~pronoun_subject~pronoun_object                          |                                   |
| ~conjunction_bits~conjunction_coordinate~conjunction_subordinate |                                   |
| ~determiner_bits~determiner~pronoun_possessive~predeterminer     |                                   |
| ~possessive  | covers 'and 's at end of word     |
| ~to_infinitive   | "to" when used before a noun      |
| ~preposition~particle  | free-floating preposition tied to |
| ~comma   |                                   |
| ~quote   | covers 'and _"_ when not en       |
| ~paren   | covers opening and closing par    |
| ~foreign_word  | some unknown word                 |
| ~there_existential   | the word there used existentia    |

In addition to normal generic kinds of pos tags, words which are serving a pos-tag role different from their putative word type are marked as members of the major tag they act as part of. E.g,

|                         | description       |
|-------------------------|-------------------|
| ~noun_gerund            | verb used as a    |
|                         | ~noun             |
| ~noun_infinitive        | verb used as a    |
|                         | ~noun             |
| ~noun_omitted_adjective | an adjective      |
|                         | used as a         |
|                         | collective noun   |
|                         | (eg the beautiful |
|                         | $are \ kind)$     |
| ~adjectival_noun        | noun used as      |
|                         | adjective like    |
|                         | bank "bank        |
|                         | teller"           |
| ~adjective_participle   | verb participle   |
|                         | used as an        |
|                         | adjective         |

For <code>~noun\_gerund</code> in *I like swimming* the verb gerund *swimming* is treated as a noun (hence called noun-gerund) but retains verb sense when matching keywords tagged with part-of-speech (i.e., it would match <code>swim~v</code> as well as <code>swim~n</code>).

Additionally, there is

|                   | description                |
|-------------------|----------------------------|
| ~number           | <del>-</del>               |
| ~number           | is not a part of           |
|                   | speech, but is comprise of |
|                   | ~noun_number               |
|                   | (a normal                  |
|                   | number value               |
|                   | like 17 or                 |
|                   | seventeen)                 |
| ~adjective_number | also a normal              |
| adjective_number  | numeral value              |
|                   | and also                   |
|                   | ~placenumber)              |
|                   | like first.                |
| ~integer          | ,                          |
| ~float            |                            |
| ~positiveinteger  |                            |
| ~negativeinteger  |                            |
| ~modelnumber      | not a true                 |
|                   | number, but a              |
|                   | word with both             |
|                   | alpha and                  |
|                   | numeric                    |
| ~filename         | looks like a               |
|                   | filename with              |
|                   | extension                  |
| ~fileext          | .xxx file                  |
|                   | extension                  |

To can be a preposition or it can be special. When used in the infinitive phrase To go, it is marked ~to\_infinitive and is followed by ~noun\_infinitive.

|                  | description   |
|------------------|---|
| ~verb_infinitive | refers to a match on the infinitive form of the verb ( <i>I hear John sing</i> or <i>I will sing</i> ). |
|                  | $o_1$ $a_{iii}$ $a_{iii}$   |

|                    | description                          |
|--------------------|--------------------------------------|
| ~There_existential | refers to the use of where not       |
|                    | involving                            |
|                    | location,                            |
|                    | meaning the                          |
|                    | existence of, as in There is no      |
|                    | future.                              |
| ~Particle          | refers to a                          |
| 1 al title         | preposition                          |
|                    | piece of a                           |
|                    | compound verb                        |
|                    | idiom which                          |
|                    | allows being                         |
|                    | separated from                       |
|                    | the verb. If you                     |
|                    | say $I$ will call                    |
|                    | off the meeting,                     |
|                    | call_off is the                      |
|                    | composite verb                       |
|                    | and is a single                      |
|                    | token. But if                        |
|                    | you split it as                      |
|                    | in $I$ will call the                 |
|                    | $meeting\ off,$                      |
|                    | then there are                       |
|                    | two tokens.                          |
|                    | The original                         |
|                    | form of the verb                     |
|                    | will be call and                     |
|                    | the canonical                        |
|                    | form of the verb                     |
|                    | will be call_off, while the          |
|                    |                                      |
|                    | free-standing off<br>will be labeled |
|                    | ~particle.                           |
| ~verb_present      | will be used for                     |
| . 51 5_P1 55 511 6 | normal present                       |
|                    | verbs not in                         |
|                    | third person                         |
|                    | singular like $I$                    |
|                    | walk  and                            |
|                    |                                      |

|                   | description  |
|-------------------|--|
| ~verb_present_3ps | will be used for<br>things like he<br>walks  |
| ~possesive        | refers to 's and 'that indicate possession, while possessive pronouns get their own labeling |
| ~pronoun_subject  | rpronoun_possessive. is a pronoun used as a subject (like he)                                |
| ~pronoun_object   | refers to objective form like $him$  |

Individual words serve roles in the parse of a sentence, which are retrievable. These include:

|                      | description      |
|----------------------|------------------|

and special concepts:  $| \sim capacronym |$  word is in all caps (and &) and is likely an acronym

# System Variables

The system has some predefined variables which you can generally test and use but not normally assign to. These all begin with %. Ones that are reasonable to set are written in bold underline. Boolean values are always 1 or null on returns. 1 or 0 if you are setting them.

Date & Time & Numbers

| variable   | description   |
|------------|---|
| %date      | one or two digit day of the month   |
| %day       | Sunday, etc   |
| %daynumber | r1-7 where $1 = Sunday$   |
| %fulltime  | seconds representing the current time and date (Unix epoch time)  |
| %hour      | 0-23  |
| %timenumbe | erempletely consistent full time info in numbers  |
|            | that you can do _0 =  |
|            | ^burst(%timenumbers) to get _0 = seconds (2digit) _1=minutes (2digit) _2=hours (2digit) _3=dayinweek(0-6 Sunday=0) _4=dateinmonth (1-31) _5=month(0-11 January=0) _6=year. You need to get it simultaneously if you want to do accurate things with current time, since retrieving %hour %minute separately allows time to change between calls |
| %leapvear  | boolean if current year is a leap year  |
|            | salvoings if current within daylight savings  |
| %minute    | 0-59  |
| %month     | 1-12  (January = 1)   |
| %monthname | January, etc  |
| %second    | 0-59  |
| %volleytin | meumber of seconds of computation since volley  |
| v          | input started   |
| %time      | hh:mm in military 24-hour time  |
| %week      | 1-5 (week of the month)   |
| %year      | e.g., 2011  |
| %rand      | get a random number from 1 to 100 inclusive   |

Time and date information are normally local, relative to the system clock of the machine CS is running on. See \$cs\_utcoffset for adjusting time based on relationship to utc (e.g your server is in Virginia and you are in Colorado).

### User Input

| variable | description |
|----------|-------------|
| %bot     | current     |
|          | bot         |
|          | responding  |

| variable      | description              |
|---------------|--------------------------|
| %revisedinput | Boolean                  |
|               | is                       |
|               | $\operatorname{current}$ |
|               | input                    |
|               | $_{ m from}$             |
|               | input                    |
|               | $\operatorname{not}$     |
|               | $\operatorname{direct}$  |
|               | $_{ m from}$             |
|               | user                     |
| %command      | Boolean                  |
|               | was the                  |
|               | user                     |
|               | input a                  |
|               | command                  |
| %foreign      | Boolean                  |
|               | is bulk                  |
|               | of the                   |
|               | sen-                     |

### Build data

| variable                | description  |
|-------------------------|--|
| %dict<br>%engine<br>%os | date/time the dictionary was built date/time the engine was compiled os invovled (linux windows mac ios) |
| %script<br>%version     | date/time build1 was compiled engine version number  |

You actually can assign to any of them. This will override them and make them return what you tell them to and is a particularly BAD thing to do if this is running on a server since it affects all users (unless you reset the variable at the end of the volley. Assigning a period to a variable resets it).

Typically one does this as a temporary assignment in a #! comment line to set up conditions for testing using :verify.

Making them return a new value is NOT the same thing as making the engine have a different value. Unless the variable is marked as settable, setting a value affects only the value returned by a future call to the system variable. It does not change engine values the variable is meant to reflect.

## Control Over Input

The system can do a number of standard processing on user input, including spell correction, proper-name merging, expanding contractions etc. This is managed by setting the user variable \$cs\_token.

The default one that comes with Harry is:

The #signals a named constant from the dictionarySystem.h file. One can set the following:

These enable various LIVEDATA files to perform substitutions on input:

| flag   | description  |
|--|--|
| #DO_ESSENTIALS   | perform LIVEDATA/systemessentials which            |
|  | mostly strips off trailing punctuation and sets    |
|  | corresponding flags instead                        |
| #DO_SUBSTITUTES  | perform LIVEDATA/substitutes                       |
| #DO_CONTRACTIONS   | perform LIVEDATA/contractions, expanding           |
|  | contractions                                       |
| #DO_INTERJECTIONS  | perform LIVEDATA/interjections, changing           |
|  | phrases to interjections                           |
| #DO_BRITISH  | perform LIVEDATA/british, respelling brit words    |
|  | to American  |
| #DO_SPELLING   | performs the LIVEDATA/spelling file (manual        |
|  | spell correction)                                  |
| #DO_TEXTING  | performs the LIVEDATA/texting file (expand         |
|  | texting notation)                                  |
| #DO_SUBSTITUTE_SYSTEM  | do all LIVEDATA file expansions                    |
| #DO_INTERJECTION_SPLITTINGAk off leading interjections into own sentence |  |
| #\$DO_NUMBER_MERGE   | merge multiple word numbers into one (four and     |
|  | twenty)  |
| #\$DO_PROPERNAME_MERGE   | merge multiple proper name into one (George        |
|  | Harrison)  |
| #DO_DATE_MERGE   | merge month day and/or year sequences (January     |
|  | 2, 1993)   |
| #JSON_DIRECT_FROM_OOB  | asking the tokenizer to directly process OOB data. |
|  | See ^jsonparse in JSON manual.                     |

The contents of the files are pairs of tokens per line. Left is the word to replace and right is the replacement. When multiple words are involved, the left side uses underscores to represent this and the right side uses +. If the right side is missing, it means just delete.

If any of the above items affect the input, they will be echoed as values into <code>%tokenFlags</code> so you can detect they happened. The next changes do not echo into <code>%tokenFlags</code> and relate to grammar of input:

| flag  | description   |  |
|---|---|--|
| DO_POSTAG   | allow pos-tagging (labels like ~noun ~verb become marked) |  |
| DO_PARSE  | allow parser (labels for word roles like ~main_subject)   |  |
| DO_CONDITIONAL_POSTAGerform pos-tagging only if all words are known.                          |   |  |
|   | Avoids wasting time on foreign sentences in particular    |  |
| ${\tt NO\_CONDITIONAL\_IDIOM\ will\ not\ perform\ substitutions\ in\ the\ dictionary\ which}$ |   |  |
|   | are considered conditional idioms                         |  |

| flag                 | description  |
|----------------------|--|
| NO_ERASE             | where a substitution would delete a word entirely as junk, don't   |
| DO_SPLIT_UNDERSCORES | happens after all other input tokenization and adjustments except number merge, and separates words that have been conjoined either because the dictionary has them ( <code>credit_card</code> ) or because they were merged by proper name merging, or by substitution. The result is only words without underscores (excluding number words like <code>five_thousand_and_four</code> |
| MARK_LOWER           | if a word is considered a proper name in CS and is marked as an upper case word, this will force it to perform any markings for its lower case form as well. Sometimes users type stuff in upper case that really should be lower  |

Normally the system tries to outguess the user, who cannot be trusted to use correct punctuation or casing or spelling. These block that:

| flag   | description |
|--------|-------------|
| STRICT | _EXASEING   |
|        | for 1st     |
|        | word of     |

#### Note

you can change \$cs\_token on the fly and force input to be reanalyzed via ^retry(SENTENCE). I do this when I detect the user is trying to give his name, and many foreign names might be spell-corrected into something wrong and the user is unlikely to misspell his own name.

Just remember to reset \$cs\_token back to normal after you are done. Here is one such way, assuming \$stdtoken is set to your normal tokenflags in your bot definition outputmacro:

If you type my name is Rogr into a topic with this, the original input is spell-corrected to my name is Roger, but this will change the \$cs\_token over to one without spell correction and redo the sentence, which will now come back with my name is Rogr and be echoed correctly, and \$cs\_token reset.

That's assuming nothing else would run differently and trap the response elsewhere. If you were worried about that, it would be possible for the script to save where it is using <code>fgetrule(tag)</code> and modify your control script to return immediate control to here after input processing if you had changed <code>\$cs\_token</code>.

### **Private Substitutions**

While in general, substitutions are defined in the LIVEDATA folder, you can define private substitutions for your specific bot using the scripting language. You can say

```
replace: xxx yyyyy
```

which defines a substitution just like a livedata substitution file. It actually creates a substitution file called privateO.txt or private1.txt in your TOPIC folder.

Even then, those substitutions will not be enacted unless you explicitly add to the \$cs\_token value #DO\_PRIVATE, eg

The left side of the substitution pair is case insensitive (matches either case on input) and can be placed in double-quotes (which converts spaces to underscores internally).

The right side of the substitution pair is case sensitive and can be placed in double-quotes (which converts spaces to plus signs internally).

Similarly while canonical values of words can be defined in LIVEDATA/SYSTEM/canonical.txt, you can define private canonical values for your bots by using the scripting language. You can say:

```
canon: oh 0 faster fast
```

which defines new canonical values for things and creates a file canon0.txt or canon1.txt in your TOPIC folder.

If you want to set a canonical pair from a table during compilation, you can use a function to do the same thing (but only 1 pair at a time).

^canon(word canonicalform)

#### **Numeric Substitutions**

A special kind of private substitution (equally applicable in regular substitution files) is the numeric substitution.

```
replace: ?_km kilometers
```

The ?\_ matches a digit number followed immediately by km, like 1.2km and will separate the number and replace the units with the given replacement. The input can be singular or have an 's' like 10.5dollars. And it can be with or without abbreviation periods, like 10kps or 10k.p.s

### Apostrophe Substitutions replace

replace: 'xxx yyy

allows you to split during tokenization any word followed by 'xxx into two words, original sans 'xxx and yyy. eg

replace: 've have

gives "companies've =>"companies have".

### Replacing to a word with + in it

Normally replace: x y+z will generate 2 words, y and z. If you need a plus in your word, you can escape your 2nd word:

replace: "black and decker" \BLACK+DECKER

# Interchange Variables

The following variables can be defined in a script and the engine will react to their contents.

| interchange variable | description |
|----------------------|-------------|
| \$cs_token           | described   |

## interchange variable description $cs_{\without model} \$ matchvariable covers multiple words, what $\operatorname{should}$ separatethemby default it's a space, but underscore is handy too. Initial system character is space, creating ${\it fidelity}$ with what was typed. Useful if $\_$ can be recognized in input (web addresses). Changing to \_ is consistent with multi-41 word representation

and keyword recogni-

\$cs\_saveusedJson exists as a kind of garbage collection. Nowadays most facts will come from JSON data either from a website or created in script. But keeping on top of deleting obsolete JSON may be overlooked. When this variable is non-null, ChatScript will automatically destroy any JSON fact that cannot trace a JSON fact path back to some user variable. Variables that have as values the name of a JSON object or array automatically protect all JSON facts underneath. JSON references merely within some text string will not protect anything, nor will references from some other non-JSON fact.
