ChatScript System Variables and Engine-defined Concepts

Copyright Bruce Wilcox, gowilcox@gmail.com www.brilligunderstanding.com Revision $11/26/2020~{\rm cs}10.8$

- Engine-defined Concepts
- System Variables
- Control over Input
- Interchange Variables

Engine-defined concepts

In addition to concepts defined in script files, the system automatically defines a bunch of dictionary-based sets as well as dynamically computed concept members.

set	description
~web_url	word is a web url
~email_url	word is an email address
~kindergarten	word learned early in life
~grade1_2	word learned in these grades
~grade3_4	word learned in these grades
~grade_5-6	word learned in these grades.
	Unmarked words are learned
	even later
~utf8	word has nonascii characters
~daynumber	word could be a number of a day
	in a month
~yearnumber	word could be the number of a
	recent year
~dateinfo	phrase is month day year of
	some kind
~kelvin	temperature marker
~celcius	temperature marker
~fahrenheit	temperature marker
~twitter_name	twitter user name
~hashtag_label	twitter topic reference

Interjections, "discourse acts", and concept sets

Some words and phrases have interpretations based on whether they are at sentence start or not. E.g., good day, mate and It is a good day are different for good day.

Likewise sure and I am sure are different.

Words that have a different meaning at the start of a sentence are commonly called interjections.

In ChatScript these are defined by the livedata/interjections.txt file. In addition, the file augments this concept with "discourse acts", phrases that are like an interjection. All interjections and discourse acts map to concept sets, which come thru as the user input instead of what they wrote.

For example yes and sure and of course are all treated as meaning the discourse act of agreement in the interjections file. So you don't see yes, I will go coming out of the engine.

The interjections file will remap that to the sentence \sim yes, breaking off that into its own sentence, followed by I will qo as a new sentence.

These generic interjections (which are open to author control via interjections.txt) are:

interjection	description
~yes	
~no	
~emomaybe	
~emohello	
~emogoodbye	
~emohowzit	
~emothanks	
~emolaugh	
~emohappy	
~emosad	
~emosurprise	
$ ilde{\ }$ emomisunderstand	
~emoskeptic	
~emoignorance	
~emobeg	
~emobored	
~emopain	
~emoangry	
~emocurse	
~emodisgust	
~emoprotest	

interjection	description
~emoapology ~emomutual	

Because all interjections at the start of a sentence are broken off into their own sentence, this kind of pattern does not work:

u: (~yes _*)

You cannot capture the rest of the sentence here, because it will be part of the next sentence instead. This means interjections act somewhat differently from other concepts.

If you use a word in a pattern which may get remapped on input, the script compiler will issue a warning. Likely you should use the remapped name instead.

The following concepts are triggered by exactly repeating either the chatbot or oneself (to a repeat count of how often repeated). Repeats are within a recency window of about 20 volleys.

concept	description
~repeatme	
~repeatinput1	
~repeatinput2	
~repeatinput3	
~repeatinput4	
~repeatinput5	
~repeatinput6	

POS (Part of Speech) Tags

Words will have pos-tags attached, specififying both generic and specific tag attributes, eg., ~noun, ~noun_singular.

Generic Specifics

nouns	description
~noun	
~noun_singular	
~noun_plural	
~noun_proper_singular	
~noun_proper_plural	

nouns	description
~noun_gerund	
~noun_number	
~noun_infinitive	
~noun_omitted_adjective	
verbs	description
~verb	
~verb_present	
~verb_present_3ps	
~verb_infinitive	
~verb_present_participle	
~verb_past	
~verb_past_participle	
~aux_verb	
~aux_verb_present	
~aux_verb_past	
~aux_verb_future	
~aux_verb_tenses	
~aux_be	
~aux_have	
~aux_do	

Auxilliary verbs are segmented into normal ones and special ones. Normal ones give their tense directly. Special ones give their root word. The tense of the be/have/do verbs can be had via `properties() and testing for verb tenses

adjectives	description
~adjective	
~adjective_normal	
~adjective_number	
~adjective_noun	
~adjective_participle	
adjectives in comparative form	n description
~more_form~most_form	
~adverb	
~adverb_normal	

adverbs in comparative form	description
~more_form~most_form	
~pronoun~pronoun_subject~pronoun_object	
~conjunction_bits~conjunction_coordinate~conjunction_subordinate	
~determiner_bits~determiner~pronoun_possessive~predeterminer	
~possessive	covers 'and 's at end of word
~to_infinitive	"to" when used before a noun
~preposition~particle	free-floating preposition tied to
~comma	
~quote	covers 'and _"_ when not en
~paren	covers opening and closing par
~foreign_word	some unknown word
~there_existential	the word there used existentia

In addition to normal generic kinds of pos tags, words which are serving a pos-tag role different from their putative word type are marked as members of the major tag they act as part of. E.g,

	description
~noun_gerund	verb used as a
	~noun
~noun_infinitive	verb used as a
	~noun
~noun_omitted_adjective	an adjective
	used as a
	collective noun
	(eg the beautiful
	$are \ kind)$
~adjectival_noun	noun used as
	adjective like
	bank "bank
	teller"
~adjective_participle	verb participle
	used as an
	adjective

For <code>~noun_gerund</code> in *I like swimming* the verb gerund *swimming* is treated as a noun (hence called noun-gerund) but retains verb sense when matching keywords tagged with part-of-speech (i.e., it would match <code>swim~v</code> as well as <code>swim~n</code>).

Additionally, there is

	description
~number	is not a part of speech, but is comprise of rnoun_number (a normal number value like 17 or seventeen)
~adjective_number	also a normal numeral value and also ~placenumber) like first.
~integer	J
~float	
~positiveinteger	
~negativeinteger	
~modelnumber	not a true number, but a word with both alpha and numeric
~filename	looks like a filename with extension

To can be a preposition or it can be special. When used in the infinitive phrase To go, it is marked $\neg to_infinitive$ and is followed by $\neg noun_infinitive$.

	description
~verb_infinitive	refers to a
	match on the
	infinitive form
	of the verb $(I$
	hear John sing
	or I will $sing$).

	description
~There_existential	refers to the use of where not
	involving
	location,
	meaning the
	existence of, as in There is no
	future.
~Particle	refers to a
1 al title	preposition
	piece of a
	compound verb
	idiom which
	allows being
	separated from
	the verb. If you
	say I will call
	off the meeting,
	call_off is the
	composite verb
	and is a single
	token. But if
	you split it as
	in I will call the
	$meeting\ off,$
	then there are
	two tokens.
	The original
	form of the verb
	will be call and
	the canonical
	form of the verb
	will be call_off, while the
	free-standing off will be labeled
	~particle.
~verb_present	will be used for
. 51 5_P1 55 511 6	normal present
	verbs not in
	third person
	singular like I
	walk and

	description
~verb_present_3ps	will be used for things like he walks
~possesive	refers to 's and 'that indicate possession, while possessive pronouns get their own labeling
~pronoun_subject	rpronoun_possessive. is a pronoun used as a subject (like he)
~pronoun_object	refers to objective form like him

Individual words serve roles in the parse of a sentence, which are retrievable. These include:

	description
~mainsubject	
~mainverb	
~mainindirect	
~maindirect	
~subject2	
~verb2	
~indirectobject2	
~object2	
~subject_complement	adjective object
	of sentence
	involving
	linking verb
~object_complement	2ndary noun or
	infinitive verb
	filling
	modifying
	mainobject or
	object2
~conjunct_noun~conju	nct_verb~conjun

	description
~postnominalAdjective	adjective
	occuring
	AFTER the
	noun it
	modified
~reflexive	reflexive
	pronouns
~not	
~address	noun used as
	addressee of
	sentence
~appositive	noun restating
	and modifying
	prior noun
~absolutephrase	special phrase
	describing
	whole sentence
~omittedtimeprep	modified time
	word used as
	phrase but
	lacking
	preposition
	(Next tuesday I
	will go)
~phrase	a prepositional
	phrase start
	(except
~clause	a subordinate
, ,	clause start
~verbal	a verb phrase

and special concepts: | ~capacronym | word is in all caps (and &) and is likely an acronym | ~emoji | word starts and end with : and represents an emoji

System Variables

The system has some predefined variables which you can generally test and use but not normally assign to. These all begin with %. Ones that are reasonable to set are written in bold underline. Boolean values are always 1 or null on returns. 1 or 0 if you are setting them.

Date & Time & Numbers

variable	description	
%date	one or two digit day of the month	
%day	Sunday, etc	
%daynumber	r1-7 where $1 = Sunday$	
%fulltime	seconds representing the current time and date	
	(Unix epoch time)	
%fullmsti	nNumeric full time/date in milliseconds (Unix	
	epoch time)	
%hour	0-23	
%timenumb	erempletely consistent full time info in numbers	
	that you can do _0 =	
	^burst(%timenumbers) to get _0 = seconds	
	(2digit) _1=minutes (2digit) _2=hours (2digit)	
	$_3$ =dayinweek $(0-6 \text{ Sunday}=0) _4$ =dateinmonth	
	$(1-31)$ _5=month $(0-11$ January= $0)$ _6=year.You	
	need to get it simultaneously if you want to do	
	accurate things with current time, since	
	retrieving %hour %minute separately allows	
	time to change between calls	
	boolean if current year is a leap year	
%daylight:	salvoides if current within daylight savings	
%minute	0-59	
%month	1-12 (January = 1)	
%monthname	January, etc	
%second	0-59	
%volleytin	%volleytimeumber of seconds of computation since volley	
	input started	
%time	hh:mm in military 24-hour time	
%zulutime	2016-07-27T11:38:35.253Z	
%week	1-5 (week of the month)	
%year	e.g., 2011	
%rand	get a random number from 1 to 100 inclusive	

Time and date information are normally local, relative to the system clock of the machine CS is running on. See \$cs_utcoffset for adjusting time based on relationship to utc (e.g your server is in Virginia and you are in Colorado).

User Input

variable	description

Build data

variable	description
%dict %engine %os %script %version	date/time the dictionary was built date/time the engine was compiled os invovled (linux windows mac ios) date/time build1 was compiled engine version number
%version	engine version number

You actually can assign to any of them. This will override them and make them return what you tell them to and is a particularly BAD thing to do if this is running on a server since it affects all users (unless you reset the variable at the end of the volley. Assigning a period to a variable resets it).

Typically one does this as a temporary assignment in a #! comment line to set up conditions for testing using :verify.

Making them return a new value is NOT the same thing as making the engine have a different value. Unless the variable is marked as settable, setting a value affects only the value returned by a future call to the system variable. It does not change engine values the variable is meant to reflect.

Control Over Input

The system can do a number of standard processing on user input, including spell correction, proper-name merging, expanding contractions etc. This is managed by setting the user variable \$cs_token.

The default one that comes with Harry is:

```
$cs_token = #DO_INTERJECTION_SPLITTING |
    #DO_SUBSTITUTE_SYSTEM |
    #DO_NUMBER_MERGE |
    #DO_PROPERNAME_MERGE |
    #DO_SPELLCHECK |
    #DO_PARSE
```

The #signals a named constant from the dictionarySystem.h file. One can set the following:

These enable various LIVEDATA files to perform substitutions on input:

flag	description
#DO_ESSENTIALS	perform LIVEDATA/systemessentials which mostly strips off trailing punctuation and sets corresponding flags instead
#DO_SUBSTITUTES #DO_CONTRACTIONS	perform LIVEDATA/substitutes perform LIVEDATA/contractions, expanding contractions
#DO_INTERJECTIONS	perform LIVEDATA/interjections, changing
#DO_BRITISH	phrases to interjections perform LIVEDATA/british, respelling brit words to American
#DO_SPELLING	performs the LIVEDATA/spelling file (manual spell correction)
#DO_TEXTING	performs the LIVEDATA/texting file (expand texting notation)
#DO_SUBSTITUTE_SYSTEM #DO_INTERJECTION_SPLIT #\$DO_NUMBER_MERGE	do all LIVEDATA file expansions TIMGA off leading interjections into own sentence merge multiple word numbers into one (four and
##DO_NOTIDEIC_TERIORE	twenty)
#\$DO_PROPERNAME_MERGE	merge multiple proper name into one (George Harrison)
#DO_DATE_MERGE	merge month day and/or year sequences (January 2, 1993)
#JSON_DIRECT_FROM_OOB	asking the tokenizer to directly process OOB data. See `jsonparse in JSON manual.

The contents of the files are pairs of tokens per line. Left is the word to replace and right is the replacement. When multiple words are involved, the left side uses underscores to represent this and the right side uses +. If the right side is missing, it means just delete.

If any of the above items affect the input, they will be echoed as values into <code>%tokenFlags</code> so you can detect they happened. The next changes do not echo into <code>%tokenFlags</code> and relate to grammar of input:

flag	description	
DO_POSTAG	allow pos-tagging (labels like ~noun ~verb become marked)	
DO_PARSE	allow parser (labels for word roles like ~main_subject)	
DO_CONDITIONAL_POSTAGerform pos-tagging only if all words are known.		
	Avoids wasting time on foreign sentences in particular	
NO_CONDITIONAL_IDIOM will not perform substitutions in the dictionary which		
	are considered conditional idioms	

flag	description
NO_ERASE	where a substitution would delete a word entirely as junk, don't
DO_SPLIT_UNDERSCORES	happens after all other input tokenization and adjustments except number merge, and separates words that have been conjoined either because the dictionary has them (credit_card) or because they were merged by proper name merging, or by substitution. The result is only words without underscores (excluding number words like five thousand and four
MARK_LOWER	if a word is considered a proper name in CS and is marked as an upper case word, this will force it to perform any markings for its lower case form as well. Sometimes users type stuff in upper case that really should be lower

Normally the system tries to outguess the user, who cannot be trusted to use correct punctuation or casing or spelling. These block that:

flag	description
STRICT	_EXASEING
	for 1st
	word of
	a sen-
	tence,
	assume
	user
	uses
	correct
	casing
	on
	words

```
description

Note

you can change \$cs_token on the fly and force input to be reanalyzed via ^retry(SENTENCE). I do this when I detect the user is trying to give his name, and many foreign names might be spell-corrected into something wrong and the user is unlikely to misspell his own name.

Just remember to reset \$cs_token back to normal after you are done. Here is one such way, assuming \$stdtoken is set to your normal tokenflags in your bot definition outputmacro:

If you type my name is Rogr into a topic with this, the original input is spell-corrected to my name is Roger, but this will change the \$cs_token over to one without spell correction and redo the sentence, which will now come back with my name is Rogr and be echoed correctly, and \$cs_token reset.

That's assuming nothing else would run differently and trap the response elsewhere. If you were worried about that, it would be possible for the script to save where it is using <code>fgetrule(tag)</code> and modify your control script to return immediate control to here after input processing if you had changed <code>\$cs_token</code>.

%tokenflags

These are the values that % tokenflags may have after analysis of a sentence... #define PRESENT 0x00000000000000000000

#define PAST 0x0000000000000000000ULL // basic tense- both present perfect and past perfect map to it #define FUTURE 0x000000000000000ULL #define PRESENT_PERFECT 0x0000000000010000ULL // distinguish PAST PERFECT from PAST PRESENT_PERFECT #define CONTINUOUS 0x00000000000000000ULL

#define PERFECT 0x0000000000040000ULL #define PASSIVE 0x00000000000000000ULL

define IMPLIED_SUBJECT

define QUESTIONMARK

define EXCLAMATIONMARK

define PERIODMARK

define USERINPUT

define COMMANDMARK

define IMPLIED YOU

FOREIGN_TOKENS

FAULTY_PARSE

QUOTATION

NOT SENTENCE

One or more of these will be set if input was changed do to use of these files

```
#DO_ESSENTIALS
#DO_SUBSTITUTES
#DO_CONTRACTIONS
#DO_INTERJECTIONS
#DO_BRITISH
#DO_SPELLING
#DO_TEXTING
#DO_NOISE
#DO_PRIVATE
#DO_NUMBER_MERGE
#DO_PROPERNAME_MERGE
#DO_SPELLCHECK
#DO_INTERJECTION_SPLITTING
```

Private Substitutions

While in general, substitutions are defined in the LIVEDATA folder, you can define private substitutions for your specific bot using the scripting language. You can say

```
replace: xxx yyyyy
```

which defines a substitution just like a livedata substitution file. It actually creates a substitution file called privateO.txt or private1.txt in your TOPIC folder.

Even then, those substitutions will not be enacted unless you explicitly add to the $cs_ten value \#DO_PRIVATE$, eg

```
$cs_token = #D0_INTERJECTION_SPLITTING |
    #D0_SUBSTITUTE_SYSTEM |
    #D0_NUMBER_MERGE |
    #D0_PROPERNAME_MERGE |
    #D0_SPELLCHECK |
    #D0_PARSE |
    #D0_PRIVATE
```

The left side of the substitution pair is case insensitive (matches either case on input) and can be placed in double-quotes (which converts spaces to underscores internally).

The right side of the substitution pair is case sensitive and can be placed in double-quotes (which converts spaces to plus signs internally).

Note: if you privately define a substitution that leads to a known interjection, it will be treated as an interjection, marked as DO_INTERJECTIONS rather than DO_PRIVATE. Interjections do not perform an actual substitution, does not replace the words on the left with the interjection concept name on the right.

Instead interjections merely mark the phrase as being a member of that concept, leaving the actual words unchanged.

Similarly while canonical values of words can be defined in LIVEDATA/SYSTEM/canonical.txt, you can define private canonical values for your bots by using the scripting language. You can say:

canon: oh 0

canon: faster fast

which defines new canonical values for things and creates a file canon0.txt or canon1.txt in your TOPIC folder.

You can optionally add MORE_FORM or MOST_FORM as a 3rd argument, to set those flags for adjectives and adverbs.

If you want to set a canonical pair from a table during compilation, you can use a function to do the same thing (but only 1 pair at a time).

^canon(word canonicalform)

Numeric Substitutions

A special kind of private substitution (equally applicable in regular substitution files) is the numeric substitution.

replace: ?_km kilometers

The ?_ matches a digit number followed immediately by km, like 1.2km and will separate the number and replace the units with the given replacement. The input can be singular or have an 's' like 10.5dollars. And it can be with or without abbreviation periods, like 10kps or 10k.p.s

Apostrophe Substitutions replace

replace: 'xxx yyy

allows you to split during tokenization any word followed by 'xxx into two words, original sans 'xxx and yyy. eg

replace: 've have

gives "companies've =>"companies have".

Replacing to a word with + in it

Normally replace: x y+z will generate 2 words, y and z. If you need a plus in your word, you can escape your 2nd word:

replace: "black and decker" $\BLACK+DECKER$

Interchange Variables

The following variables can be defined in a script and the engine will react to their contents.

	_
interchange variable	description
\$cs_token	described
	exten-
	sively
	above

```
interchange variable
                      {\it description}
                      controls
$cs_response
                      auto-
                      matic
                      han-
                      dling of
                      outputs
                      to user.
                      By
                      default
                      it
                      consists
                      of
                      $cs_response
                      #Response_upperstart
                      #response_removespacebeforecomma
                      #response_alterunderscores
                      #response_removetilde
                      If you
                      want
                      none of
                      theses,
                      use
                      cs_response
                      =0 (all
                      flags
                      turned
                      off).
                      See
                      ^print
                      for
                      expla-
                      nation
                      of flags.
                      #response_noconvertspecial
                      - leave
                      escaped
                      n r and
                      t alone
                      in
                      output
                      and
                      \log
             34
                      #response_upperstart
                      - makes
                      the first
                      letter of
                      an
                      output
                      sen-
                      tence
```

\$cs_saveusedJson exists as a kind of garbage collection. Nowadays most facts will come from JSON data either from a website or created in script. But keeping on top of deleting obsolete JSON may be overlooked. When this variable is non-null, ChatScript will automatically destroy any JSON fact that cannot trace a JSON fact path back to some user variable. Variables that have as values the name of a JSON object or array automatically protect all JSON facts underneath. JSON references merely within some text string will not protect anything, nor will references from some other non-JSON fact.

\$cs_inputlimit=x:y for excessively long user input (excluding oob portion), the input will be truncated by keeping the first x characters and the last y characters.

\$cs_crash - This topic can generate an appropriate dummy output and CS completes that volley but does not save an updated user file. The NEXT volley coming in will force cs to completely reload itself before processing. Making a dummy output hopefully means the same fatal input will not be sent back into CS to crash it again (due to external retry when no answer is received from CS).

E.g.,

topic: ~crashtopic system ()
 t: Huh?

\$cs_addresponse names a function of 2 arguments that will be called when CS wants put text into the output queue of the user. The first argument will be what CS wants to output. The second is the rule tag that generated this output. If the function returns a failure code, the message will be aborted and not put into the queue. If the function returns a text value (not null) then that message will replace what was intended to go to the user.
